Final Project

AnimalFind provides a place for people to come and learn about zoo animals. On each page you can read a fun fact of the animal, and you can scroll down to see a map where you find the cages of the animals in the Potawatomi zoo. Our website follows the basic layout provided with AnimalZoom example. We found the Google Maps API to be very interesting and effective function for the AnimalZoom application. So, instead of spending a large portion of time changing the pictures and layout of the website, we spent a large portion of our time upgrading the Google Maps API usage. We made sure to modify the text description, header formats, and other fields to make our project unique.

The user can navigate to any page corresponding to the original animals. The description is changed to a fun fact about the animal, and there the user can also see where the animal cage is located in the zoo. The ZoomTime page still exists where you can view all of the animals at once, and the Zoo page can show you where all of the animal cages are located relative to one another. Attached is screenshots of pages from our website.

Camel

Fun Fact: camels have three sets of eyelids and two rows of eyelashes to keep sand out of their eyes.

Camel

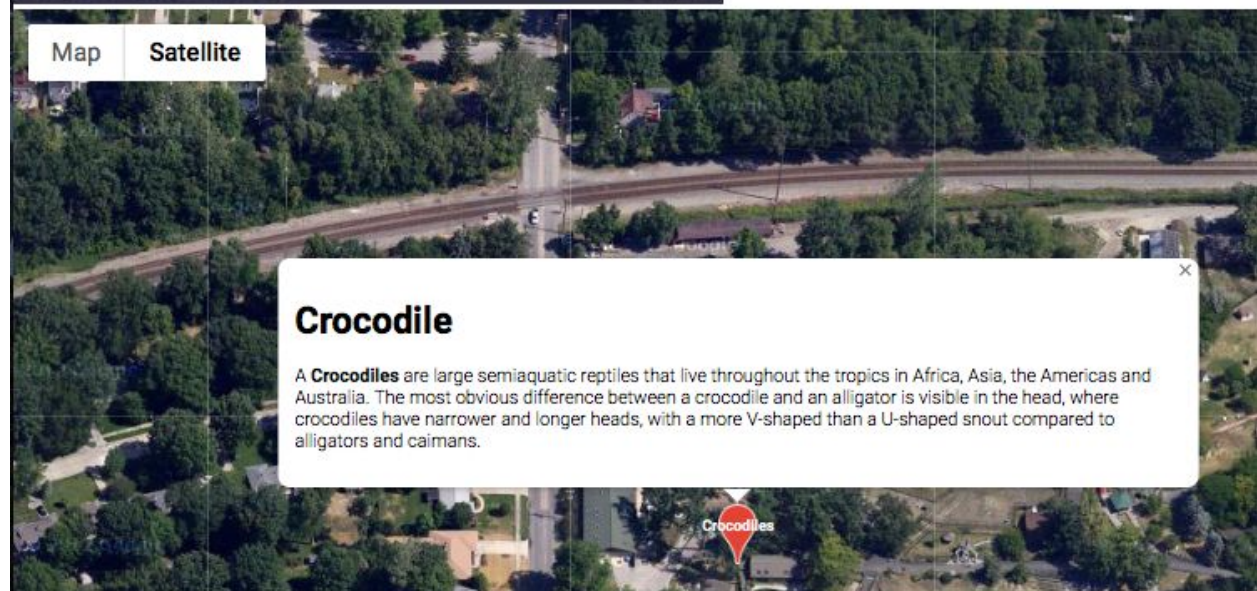

A **Camel** is an even-toed ungulate in the genus *Camelus* that bears distinctive fatty deposits known as humps on its back.

Crocodile

A **Crocodiles** are large semiaquatic reptiles that live throughout the tropics in Africa, Asia, the Americas and Australia. The most obvious difference between a crocodile and an alligator is visible in the head, where crocodiles have narrower and longer heads, with a more V-shaped than a U-shaped snout compared to alligators and caimans.
